Table with Footnotes

Andy Merlino

Thursday, November 20, 2014

Attempting to create a LATEX table with good footnotes. I need the table to be generated using an existing R package for generating LATEX tables from R code. Thus, the footnote command cannot be directly typed into the table; it must flow through the R package for table generation.

The xtable package

This seems to be the best option:

Exhibit I, Sheet 1

	${\rm col.one^1}$	$\rm col.two^1$	$col.three^2$
A	1.10	4.00	TRUE
В	9.90	7.00	TRUE
\mathbf{C}	2.30	8.00	FALSE

 $^{^{1}\}mathrm{This}$ is my first explicit footnote

²This is my second explicit footnote

For more information see Exhibit I, Sheet 1
